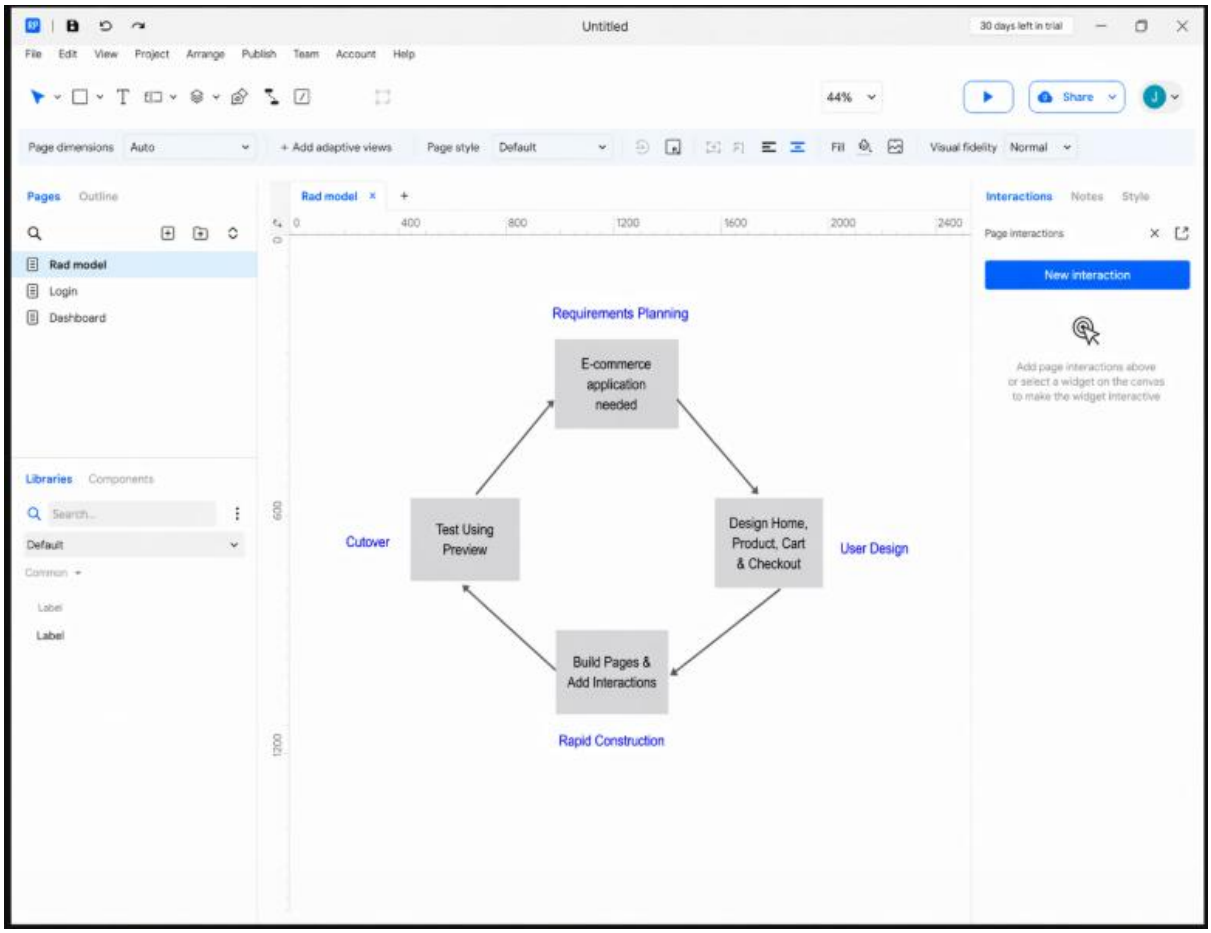
EXPERIMENT-6

NAME:JAI VARDHAN UL ROLL NO:240701201

What is Rad model?

(Rad) model in user interface (UI) design and software engineering is an iterative, agile methodology that prioritizes Rapid prototyping, user feedback, and fast development cycles over long-term, Rigid planning. it is specifically designed to create high-quality, functional software quickly by involving users throughout the process, making it ideal for UI-driven projects.

diagrammatic Representation of Rad model:



1. Requirements Planning

- Identified the need for a login system
- User should enter username and password
- System should navigate to dashboard
- Simple and user-friendly interface required

2. User Design

- Created login page layout
- Added username and password fields
- Designed dashboard page
- Placed buttons and labels properly

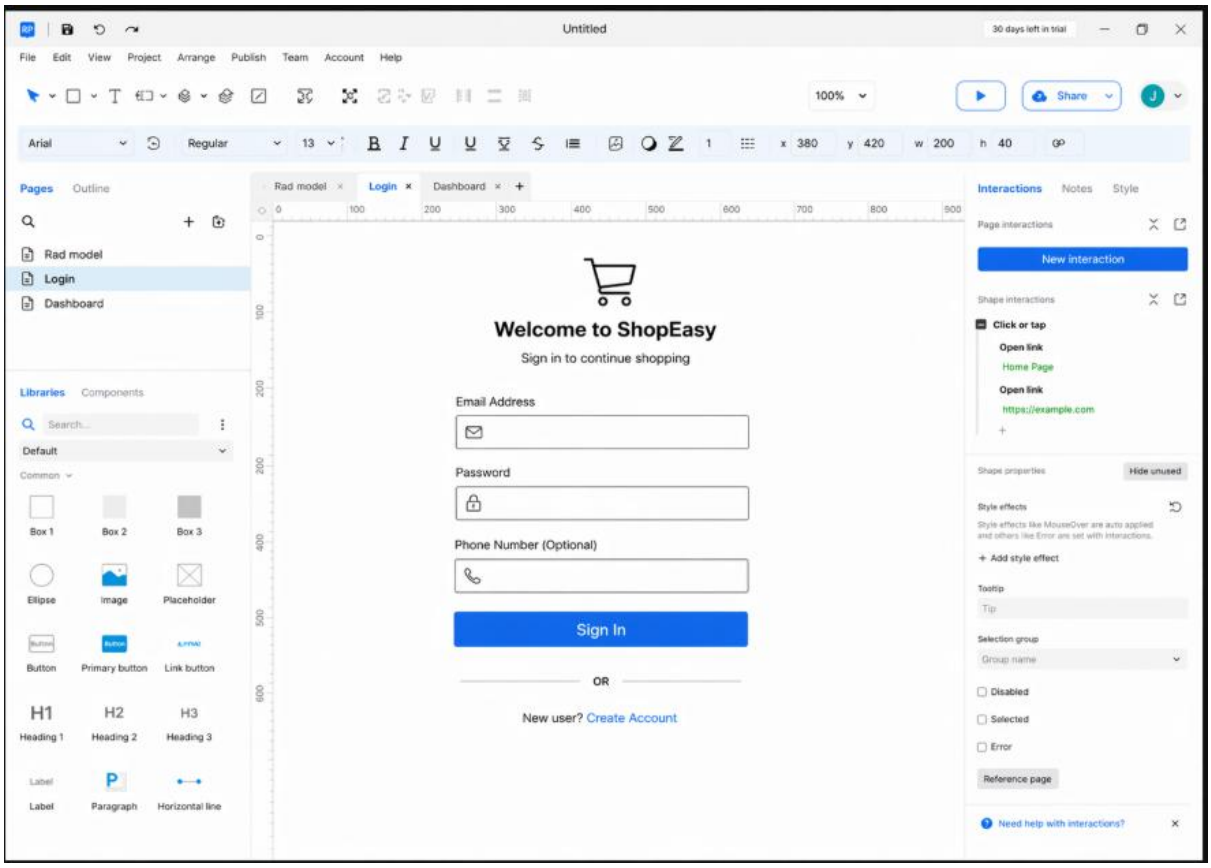
3. Rapid Construction

- Implemented UI using Axure RP
- Added login button interaction
- Linked login → dashboard
- Added logout button → back to login

4. Cutover (Testing)

- Tested using preview mode
- Verified login navigation works
- Verified logout functionality
- Checked overall UI flow

LOGIN PAGE:

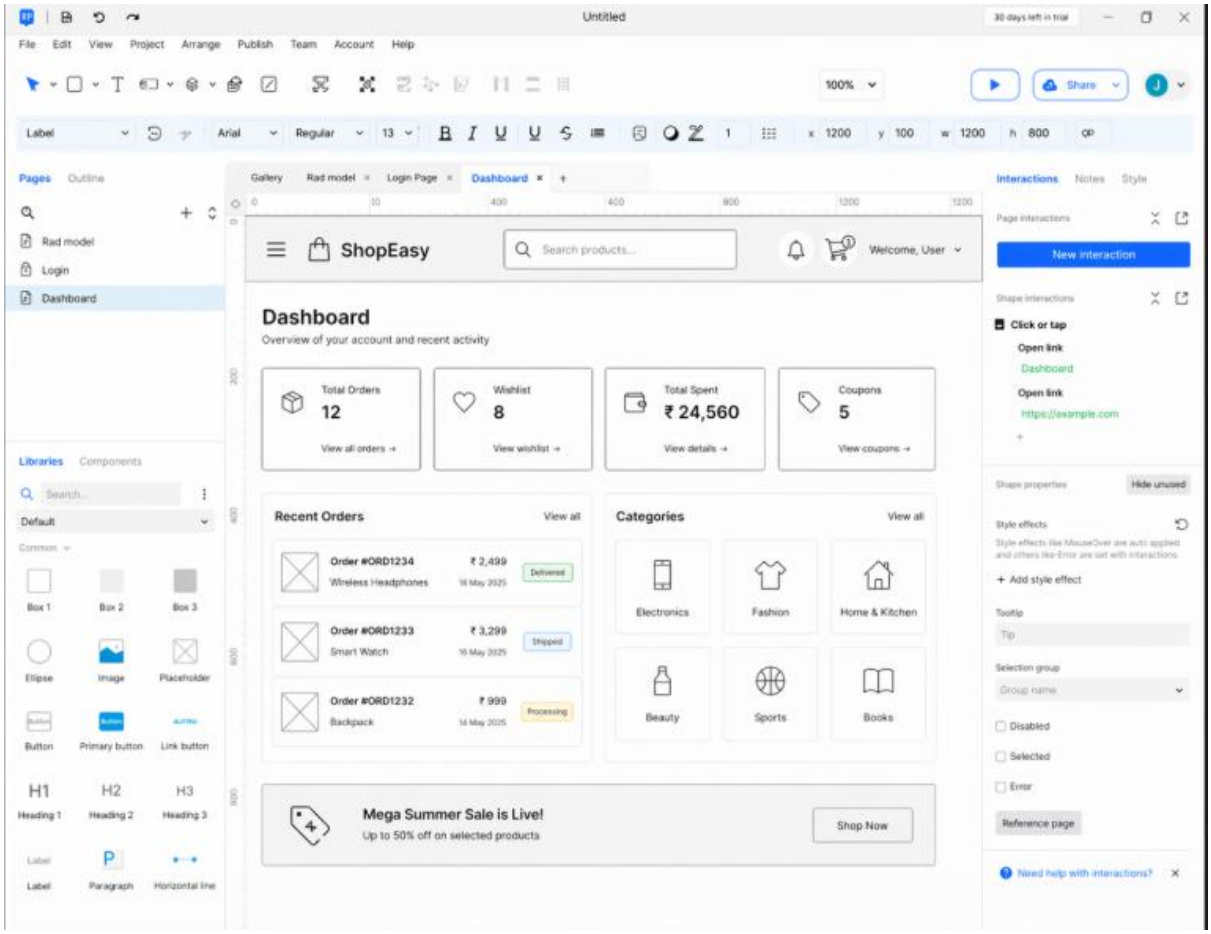


The login page is the main interface where users enter their credentials to access the system. It contains input fields for username and password along with a login button.

The design is simple and user-friendly so that users can easily interact with the application.

When the user enters the details and clicks the login button, the system navigates to the dashboard page. The layout is properly arranged with clear labels for better usability.

DASHBOARD:



The dashboard page is displayed after successful login and acts as the main interface of the system. It shows a welcome message and provides a logout option.

The design is simple and easy to understand, allowing smooth navigation for the user.

When the user clicks the logout button, the system redirects back to the login page. This ensures proper flow and control in the application.

Advantages

- Faster development compared to traditional models
- Easy to modify and update UI at any stage
- Continuous user feedback improves design quality
- Quick prototyping and testing

- Reduces development time and effort
- Suitable for small and medium UI-based projects

Disadvantages

- Not suitable for large and complex systems
- Requires skilled developers/designers
- Depends heavily on user involvement
- Difficult to manage without proper planning
